                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to an antisense compound encoding Fas, Fas ligand, or Fas associated protein-1 (Fap-1). The inhibition of Fas mediated signalling is thought to be immunosuppressive, antiinflammatory, hepatricopic, cytostatic and vasotropic. Antisense oligonuclectides were designed to target human Fas. Oligonucleotides were synthesised as chimeric oligonucleotides and are useful for treating an animal having an autoimmune or inflammatory disease e.g., hepatitis, cancer, a condition associated with apoptosis, allograft rejection, or ischemia reperfusion injury. Optionally, the above mentioned conditions are prevented by contacting the allograft with the antisense oligonucleotide. The
                                                                                                                                                                                                                                                 Novel antisense compound targeted to nucleic acid encoding Fas, Fas
ligand or Fas associated protein-1 is useful for inhibiting expression of
Fas, Fas ligand, or Fap-1 in cells or tissues, and for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                oligonucleotides are used in diagnostics, therapeutics, prophylaxis and as research reagents and in kits. The oligonucleotides are also useful for research purposes. The present nucleotide sequence is related to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ss; antisense therapy; casein kinase-2 alpha; cytostatic; antidiabetic; antiinflammatory; diabetes; hyperproliferative disorder; cancer; human; breast cancer; prostate cancer; liver cancer; infection; inflammation;

The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid molecule encoding casein kinase 2-alpha. The compound specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding casein kinase 2-alpha tor specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding casein kinase 2-composition comprising the compound and a carrier or diluent; (1) a composition comprising the compound and a carrier or diluent; (2) inhibiting the expression of casein kinase 2-alpha in cells or tissues by contacting the cells or tissues with the novel compound; and (3) treating an animal having a disease or condition associated with casein kinase 2-alpha by administering to the animal the compound cited above so that expression of casein kinase 2-alpha is inhibited. The antisense compounds is inhibited. The antisense compounds or creating diseases or conditions associated with expression of casein kinase 2-alpha, e.g. diabetes or hyperproliferative disorder, particularly cancer, such as breast cancer, prostate cancer, or liver cancer. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in casein minimum between functions of various members of a biological pathway. The present sequence is a casein kinase-2 alpha antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides targeted to nucleic acid encoding casein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        kinase 2-alpha, useful in diagnostic and research applications, or for treating a disease or condition associated with expression of casein kinase 2-alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

New antisense oligonucleotides for modulating the expression of CCAAT/Enhancer-binding proteins alpha, particularly useful for preventing, delaying or treating infection, inflammation or tumor formation

Claim 1; Col 43; 44pp; English.

Sequences ABA02205-ABA02282 represent antisense oligonucleotides targeted to the human CCAAT/enhancer-binding protein alpha (C/EBP alpha) gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human C/EBP alpha RNA, and were analysed for their effect on C/EBP alpha mRNA levels by quantitative real-time PCR. A similar investigation on mouse C/EBP alpha expression was performed using a subset of the antisense oligonucleotides that were capable of hybridising to mouse C/EBP alpha mRNA. The C/EBP family of proteins are a family of transcription factors which requilate the expression of wide range of genes that control normal tissue development, cellular function, cellular proliferation and functional differentiation. C/EBP alpha (also known as CEBPA) is primarily found in tissues involved in energy metabolism which have a capacity to metabolise lipids, cholesterol and other sterols. It is thought to be involved in the useful regulation of adipocyte and chondrogenic differentation, and is also involved in follicular development and ovulation, steroid-induced cell cycle arrest in the liver, in controlling glucose transporter GIUTZ promoter activity, in the hormonal regulation of metabolism, and in granulocyte development. The oligomucleotides of the invention are usef for diagnosis, prevention and treatment of conditions associated with c/EBP expression, such as cancer, tumour formation, infection, or inflammation

```
Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1. e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disease (such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a mouse oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                             Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFR1; hepatitis; liver injury; hyperproliferative disorder; cancer; mouse; murine; ds.
                                                                                                                                                                                                                              INFR1 expression modulation related antisense oligo SEQ ID No 207.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to methods of detecting genetic deletions, translocations and mutations associated with at least one condition selected from the group consisting of DiGeorge syndrome (DGS), CHARGE association, Velocardiofacial (Shprintzen) syndrome (VCF), conortuncal defect and/or cleft palate in a human patient. DGS is linked to chromosomal deletion of chromosome 22. The method involves identifying in a sample DNA if there are less than 2 functional copies of chromosome 22q11 and including locus D2S36 to locus BCRL2, indicating a genetic for diagnosing DGS, VCF, CHARGE association, conotruncal defect and/or cleft palate, particularly in prenatal monitoring. The present sequence is a PCR primer used to amplify genomic DNA extracted from ADU, VDU and normal human lymphoblastoid cell lines and somatic cell human-hamster hybrid cell line GM10888. This sequence is used in the dosage analysis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; mouse; Zmaxl; HBM; high bone mass gene; lipid regulation; stroke; lipid-associated condition; arteriosclerosis; cardiovascular disease; ss; osteoporosis; atherosclerosis; diabetic atherosclerosis; plaque build-up; neurovascular condition; wound healing; gene therapy; PCR primer; probe;

The invention relates to a method for identifying a molecule involved in lipid regulation comprising identifying a molecule that binds to or inhibits binding of a molecule to high bone mass (HBM) or its wild type gene, Zmax1. Compounds identified by the method are useful for treating, associated conditions, including arteriosclerosis, cardiovascular disease, stroke, and osteoporosis. The compounds may also be used in the treatment or prevention of diabetic atherosclerosis, neurovascular conditions caused by plaque build-up, poor circulation due to plaque build-up and associated poor wound healing. The methods may be used in gene build-up and associated poor wound healing. The methods may be used in gene therapy, pharmaceutical development, and diagnostic assays for bone development disorders. Molecules identified by comparison of Zmax1 and HBM systems can be used as surrogate markers in pharmaceutical development, in diagnosis of human or animal bone disease, and in the treatment of bone diseases. Sequences ABK22776-ABK23411 represent cDNNs colecules encoding human Zmax1 and HBM, and PCR primers, probes, linkers and adapters of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Telomerase reverse transcriptase, TERT, cytostatic, apoptosis; cell growth inhibitor; antisense oligonucleotide; antisense technology;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying molecules involved in lipid regulation, useful for diagnosing, treating or preventing e.g., arteriosclerosis, comprises identifying a molecule that binds to high bone mass gene or its corresponding wild type gene.
bone development disorder; antiarteriosclerotic; cardiovascular;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Telomerase reverse transcriptase, antisense oligonucleotide #92.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

The invention relates to identifying agents (e.g. antibacterial peptides)

for inhibiting the growth of, or killing a bacteria (especially S. preumoniae) comprising: (a) contacting the agent with a bacteria (the bacteria cell has a defective His Asp phosphorelay pathway, especially the mutations in the genes of the ABC transporter cluster); and (b) determining whether the cell is killed or its growth is inhibited (an agent is identified as capable of killing or inhibiting the growth of a bacterial cell if the kills or inhibits the growth of the bacterial. The method identifies antibacterial agents that may be used in conjunction with penicillin to treat bacterial infections and inflammations, especially those caused by pneumococi Staphylococus aureus, Acinetobactor. Enterococus faecalis, Escherichia coli, Pseudomonas, actual of which cause blood poisoning among other ailments, Mycobacterium tuberculosis which causes tuberculosis; Shigella dysenteria which causes dysentery; and Neiseria gonorrhoeae which causes of treatment of infections due to Streptococcus pneumoniae, a bacterial conference in the causes blood poisoning, middle ear infections, pneumonia, and meningitis in humans. Additionally, the present invention provides and meningitis in humans. Additionally, the present invention provides antibiotics that can kill but not lyse autolysis prone pneumococci, especially those that may be resistant to other drugs, e.g. vancomycin. The present sequence is a printmer associated with the method of the invention.
                                                                                                                                                                                                                                                                                                       Identifying antibacterial agents which may be administered with penicillin for treating infections by drug-resistant bacteria, e.g. vancomycin resistant pneumococcal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1.7%; Score 13.8; DB 1; Length 20; 88.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a compound, 8-50 nucleobases in length targeted to a nucleic acid molecule encoding human TERT (telomerase reverse transcriptase), where the compound specifically hybridises with and inhibits the expression of TERT. A series of oligonuclectides where concerties in length and composed of a central app region consisting of the 12-deoxynuclectides, flanked on both sides (8, and 3' directions) by five-nuclectides wings. The wings were composed of 2'-methoxyethyl (2'-MOE) nuclectides. The compounds were analysed for their effect on human TERT mRNA levels by reverse transcriptase (RT) polymerase chain reaction (PCR). The compound is useful for inhibiting the expression of TERT in associated with TERT, for modulating abpoptosis, for inhibiting cell growth (preferably, cancer cell growth), in antisense therapy and for diagnostics and therapeutics. This sequence is an antisense cold molecules encoding TERT, described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; PCR; ss; trauma; viral infection; parasitic infection; addiction; bacterial infection; Alzheimer's disease; Huntington's disease; anxiety; Parkinson's disease; bankiety; Parkinson's disease; alopecia; pigmentation disorder; inflammatory disorder; arthritis; ALDS; inflammatory bowel disease; Crohn's disease; cancer; adenocarcinoma; autolimmune disease; graft versus host disease; ulcer; bullmia; anorexia; dementia; gene therapy; primer.
                                                                                                                                                                                                        The present sequence is a primer used in the PCR amplification of a 267-nucleotide portion of the translocation breakpoint region of an acute nucleotide portion of the translocation breakpoint region of an acute cell hypropholistic leuksemia (ALL) infant patient MLL gene. Panels of somatic cell hybrid DNAs and radiation hybrid DNAs were screened by PCR and the location of the translocation partner gene was determined by comparing somatic chybrid panel. The invention relates to methods for the panhandle PCR amplification of a region of DNA of unknown sequence that flanks a region of a leuksemia-associated gene, especially MLL, of known sequence in a human patient. When the method was supplied to the ALL infant patient, a translocation breakpoint was identified at nucleotide 3802 of the breakpoint cluster region (bcr) of MLL, in MLL intron 8
                                                                                                                                      Amplifying an unknown region flanking a known region of the leukemia-associated MLL gene for diagnosing leukemia, comprises using a panhandle polymerase chain reaction.
                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                              Edinger S;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human novel polynuclectides and polypeptides. The sequences are useful for the treatment, prevention and diagnosis of disorders such as trauma, viral/parasit/c/bacterial infections, Alzheimer's disease, Puntington's disease, Perkinson's disease, behavioural disorders, anxiety, addiction, pain, hair growth diseases, alopecia, pigmentation disorder, inflammatory disorders such as osteoand rheumatonid arthritis, inflammatory bowel disease, Crohn's disease, and adenocarcinoma, asthma, hypertension, autoimmune disease, disease, obesity, graft versus host disease, ulcer, bulimia, anorexia and dementia. This sequence represents a PCR primer used to amplify human novel polynucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polypeptide, designated NOVX for treating or preventing disorders or symptoms e.g. trauma, Alzheimer's disease, cancers, acquired immunodeficiency syndrome, asthma and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

```

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding regalon, 5' or 3' end genomic flanking regions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an arbiect, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of biquinone or lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed of specification, but was obtained in electronic format directly from WIPO Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ftp.wipo.int/pub/published_pct_sequences Disclosure; SEQ ID NO 8161; 872pp; English. Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 3111; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the instantion codon, coding regalon, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubjuintone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing so depleting levels of an antiinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubjuintone or lung surfactant in a subject stissue, or treating bronchocomstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation condon, coding regalon, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antialergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an prinflammatory steroid in a subject, for reducing levels of an enceptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence date for this patent is not represented in the printed of the first with interval.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

New antisense chimeric oligonucleotide, useful for modulating the expression of human Interleukin 12 p40 subunit, in treating or preventing disease states in humans and animals, and as research reagents and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an antisense compound 20-50 nucleobases in length targeted to a start codon region, coding region, a stop codon region of a 1'-untranalated region of a nucleic acid molecule encoding human Interleukin 12 p40 subunit. The compound specifically hybridises with one of the region and inhibits the expression of human Interleukin 12 p40 subunit. The new compound is useful for inhibiting the expression of human interleukin 12 p40 subunit in cells or tissues and comprises contacting the cells or tissues and comprises expression of the human Interleukin 12 p40 subunit is inhibited. The antisense compound may also be used as research reagents and diagnostics, and as treatment or prevention of disease states, e.g. to prevent or delay infection, inflammation or tumour formation, in animals and humans. The present sequence is an antisense oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, antisense, thyroid hormone receptor interactor 6, TRIP6, tumour; ODA-interacting protein-1, OIP-1, zyxin-related protein-1, prophylaxis; inflammation, therapy; hyperproliferative disorder; infection; cancer; chromosome 7q22; ZRP-1, PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ·,

The invention relates to antisense compounds targetted to a nucleic acid encoding thyroid hormone receptor interactors ( FRIEB) to inhibit its expression. TRIPG is also known as OpA-interacting protein-1 (OIP-1) and zyxin-related protein-1 (ZRP-1). TRIPG DNA is located on chromosome 7022. Antisense compounds of the invention are useful for modulating the expression of TRIPG such as hyperproliferative disorders (e.g. cancer). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various members of a biological pathway. The are also useful in antisense therapy. The present sequence is human TRIPG DNA specific PCR primer, used in the exemplification of the invention
                                                                                                    New antisense oligonucleotides targeted to nucleic acids encoding thyroid hormone receptor interactor 6, useful for diagnosing or treating hyperproliferative disorders, such as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /mod_base= OTHER

The invention relates to antisense compounds, compositions and methods for modulating the expression for activating transcription factor 3 (ATF3): also known as liver regeneration factor—1 (LRF-1), CRG-5, LRG-21, and TI-241. The invention is useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of ATF3, such as ischaemia and diabetes. The antisense compound is useful in antisense therapy. The present sequence is an antisense oligomucleotide targetted to human ATF3 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying antibiotic tolerant bacteria, especially antibiotic tolerant Streptococcus pneumoniae, by determining whether the bacteria has type 4 or R6 allele of vex2 and pep27 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    vex2; ss; PCR; primer; SNP; single nuclectide polymorphism; antibiotic tolerance; type 4 allele; R6 allele; pep27; penicillin; vancomycin; vex/pep27/vncr/s operon; pneumococcus; autolytic enzyme; LytA; signal peptide; VncS; VncR; beta-lactam.
                                                                                                                                                                                   New antisense oligonucleotide compounds, useful for diagnosing, preventing and/or treating conditions with aberrant activity of the activating transcription factor 3, such as ischemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Forward PCR primer amplifying pep27 SNP containing gene fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            음
                                      The invention discloses a method for determining whether a bacteria is likely to be tolerant to an antibiotic. The method comprises determining whether the bacteria has a type 4 or R6 allele of the vex2 gene and pep27 genes are closely associated with tolerance to periolilin and vancomycin, and the bacteria is determined to be likely to be tolerant if it has a type 4 allele of the vex2 gene and an R6 allele of the pep27. Also disclosed are PCR primers which can be used to amplify the regions of the vex2 and pep27 genes which can be used to amplify the regions of the vex2 and pep27 genes which can be used to amplify the regions of the vex2 and pep27 genes which can be used to vex/pep21/vncr/s operon encoding the major pneumococcal autolytic enzyme. UttA. The operon encodes for a signal peptide, Pep27, that is transported out of the cell via the vex dedicated transporter. Once it reaches a critical density in the supernatant, it signals through the two-component regulatory system, VncS and VncR, which subsequently induces activation of LytA. Mutations in any one of the operon genes prevents proper signaling, resulting in a lack of LytA activation and antibiotic conformation in the supernation of the cell and antibiotic whether a subject on a nantibiotic, preferably a beta-lactam such as the conventional conformation of the subject with chose antibiotics. The method is rapid and correctly predicts whether a subject can be successfully treated with a particular antibiotic can be successfully treated with a particular antibiotic can be avoided so that alternative frequence of the conventional antibiotic can be avoided so that alternative frequence of the forward PCR of the proper forward thich was used to amplify the S. pneumoniae pep27 SNP containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The invention relates to novel transgenic animals expressing the high bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRP5 or EAR6. Or expressing comprising an alteration of the gene encoding LRP5 or EAR6. Or expressing by homologous or non-homologous recombination. The transgenic animals are for the study of bone density modulation. The transgenic animals are for the study of bone therapy. The transgenic animals and nucleic acids are for the study of bone density modulation, where the composition may have a use in gene therapy. The transgenic animals and nucleic acids are for the study of bone density modulation, where the come mass is andulated relative to non-transgenic animals in more than one parameter selected from bone density, bone strength, trabecular number, bone size, or bone tissue connectivity. The transgenic animals, nucleic acids and methods are useful for identifying molecules involved in bone development, and for developing pharmaceutical compositions, which may be employed for treating or preventing bone diseases, e.g. osteopharms, of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, or meast requence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..
                                                        New transgenic animals (e.g. mice), useful as models for studying bone density modulation, developing drugs for treating or preventing bone diseases (e.g. osteoporosis), or diagnosing diseases characterized by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cancer, CYP3A5; irinotecan, pharmaceutical, malignant glioma; cytochrome p450; subfamily IIIA; nifedipine oxidase; polypeptide 5;

The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (nifediplne coxidase), polypeptica groundlectide (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate desawage and/or an appropriate derivative of (I). Therefore, undesirable, contained or toxic effects are efficiently avoided. Unnecessary and contramentally harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of the present invention sequences used in the complification of the present invention
          New use of irinotecan for preparation of compositions for treating cancer in subject having genome with variant allele comprising cytochrome p450, subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of irinotecan or its derivative for preparation of a pharmaceutical composition for treating cancer in a subject having a genome with a variant allele comprising a multidrug resistance protein 1 polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   irinotecan; colorectal cancer; cervical cancer; gastric cancer; lung cancer; malignant glioma; variant allele; multidrug resistance protein 1; MRP1; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

    The present invention describes a method for the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant gliona in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) polynucleotide (II). (I) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant gliona in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, CD36 antigen-like 1, CD36L1, scavenger receptor class B type 1, CLA-1, SRB1, SR-BI, cardiovascular, metabolic disorder, atherosclerosis, lipid metabolism, gene therapy, phosphorothioate backbone; antisense; ss

                                                                                                                                                                                                                                                                                                                                                                                                                       엄
                                                                                                                                                                                                                                                       ö
                                                  The invention relates to antisense compounds, compositions and methods for modulating the expression of class B scavenger receptor, CD36 antigen-like 1 (BD361). CD3611 is also known as scavenger receptor class B type useful for preparing a composition for treating metabolic or cardiovascular disorder, e.g. altered lipid metabolism or atherosclerosis. It is also used in gene therapy. The present sequence is an antisense oligonocleotide targetted to human CD3611 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to amplifying an unknown region that flanks a known region of a cancer-associated DNA sequence comprising providing a template polynucleotide, ligating a loop-forming oligonucleotide to the 3'-end of the sense strand, annealing the loop-forming oligonucleotide with the first portion to generate a panhandle structure, subjecting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amplifying an unknown region that flanks a known region of a cancerassociated DNA sequence by subjecting the panhandle structure to extension and to PCR in the presence of a first primer homologous to the

panhandle structure to extension, and subjecting the panhandle structure to PCR in the presence of a first primer homologous to the second portion, where the unknown region is amplified. In the method of amplifying an unknown region that flanks a known region of a cancerassociated DNA sequence, the template polynucleotide comprises a sense strand, comprising the known and unknown regions. The unknown region is nearer the 3'-end of the sense strand than is the known region is nearer the unknown region is nearer the unknown region than is the second portion. The loop-forming oligonucleotide is complementary to the first portion. The third region complementary to the second portion to the third region complementary to the second portion. The third region complementary to the second portion. The third region complementary to the second portion. The third region complementary to the second portion. The third region complementary to the second portion is generated at the free end of the loop-forming oligonucleotide. The cancer-associated DNA sequence comprises ATPI (not defined) or BCR (B call receptor). The method is useful for amplifying an unknown region that flanks a known region of a cancer-associated DNA sequence. Also disclosed as new is the use of the method in the analysis of the breakpoint region of the human MLL gene, where the chromosomal breaks results in gene fusions with AF-4, CDN-6 and leukaemia and acute myeloid leukaemia). MLL is located on chromosome liga3. The present sequence is a primer used in the analysis of the MLL breakpoint region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .

The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles, of the UGTIA1 gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIA1 gene. The invention has cytostatic activity. A composition of the invention acts as a nimple e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, generical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.
                      LRP6 mutants, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in bone mass modulation and/or lipid phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence is a Sequence Tagged Site (STS) marker, which was used to prepare a physical map of the Zmaxl (LRPS) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIAl gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIAl gene product.
invention relates to High Bone Mass (HBM), LRPS (Zmax1) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          irinotecan; cancer; UGILAL; cytostatic; topoisomerase I inhibitor; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; uridine diphosphate glycosyltransferasel member Al; gene; ds.

A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates ro a novel use of irinotecan or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignance glioma in a subject having a genome with a variant allele which comprises a multidrug resistance 1 (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The present sequence is used in the exemplification of the invention.
                                                                                                                                   irinotecan; colorectal cancer; cervical cancer; gastric cancer;

The invention relates to determining presence of at least one sequence variant (SV) in one or more target nucleic acids (NA) in a sample. The method is used in molecular biology, diagnosis and prognosis to detect specific alleles, particularly point mutations or polymorphisms. The method improves specificity of detection of a particular variant (in known methods some primer extension can occur even from a mismatched primer, leading to false positive results), and the discriminating primer used not be 3 -terminal. The present sequence represents a PCR primer used in the method of the invention Determining presence of specific nucleic acid variant, useful e.g. for diagnosis, by allele-specific amplification with a discriminating primer having a nucleotide modified at position 4 of the sugar. Sequence 20 BP; 4 A; 3 C; 8 G; 5 T; 0 U; 0 Other; Example 7; Page 19; 40pp; English

New isolated nucleic acid encoding a peptide that kills both wild type pneumococci and a strain of Pneumococcus that is autolysin deficient, useful for treating or preventing bacterial infections or inflammations.

Example 13; Col 121; Opp; English

The invention relates to novel nucleic acids encoding antibiotic peptides that kill both wild type pneumococci and a strain of Pneumococcus that is autolysin deficient. Antibiotic peptides of the invention are useful for treating or preventing bacterial infections or inflammations. They are useful in preventing or treating disease caused by a bacterium such as Estaphylosoccus aureus. Enterococcus faccalis, Pseudomonas aeruginosa, Escharichia coli, Acetobacter which all cause blood poisoning, Mycobacterium tuberculosis which causes tuberculosis, Shigella dysenteria

which causes dysentery, Neisseria gonorrhoeae which causes gonorrhoea, Streptococcus pneumoniae which causes blood poisoning, pneumonia, middle ear infections and meningitis in humans. The peptides can be employed as preservatives or as part of a composition used as preservatives. They can also be used as a laboratory tool, e.g. in conjunction with one or more bacteria and as drug selection markers. The present sequence is Streptococcus pneumoniae p27 bNA amplifying PCR primer. This sequence is used in the exemplification of the invention

```

```
The invention relates to a compound 8-30 mucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding caspase 8 (a protein involved in appotosis), and inhibits the expression of caspase 8, i.e. an antisense oligomucleotide. Also included are a compound 8-30 nucleobases in length that specifically hybridises with at least an 8-uncleobases portion of an active site on a nucleic acid molecule encoding caspase 8, a composition comprising the compound and a carrier or diluent, inhibiting the expression of caspase 8 in cells or tissues with the compound so that expression of caspase 8 is inhibited) and treating an animal having a disease or condition associated with caspase 8 by administering to the animal a therapeutic or prophylactic amount of the compound so that a cappassion of caspase 8 is inhibited. The compound, composition and methods are useful for treating a disease or condition associated with caspase 8, such as hyperproliferative, haematopoietic or autoimmune caspase 8, such as hyperproliferative, haematopoietic or autoimmune caspase 8, viral infection such as AIDS, neurological disorders (e.g. Alzhaimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa), blood cell disorders and cancer. They are also useful in research and diagnostics for modulating the expression of interleukin 8. The present sequence is a caspase-8 targeting antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ·,

SEQ ID NO 61; 152pp; English Example; $\overset{\circ}{\mathbf{x}}\overset{\circ}$

The present invention describes an isolated nucleic acid molecule (I) comprising a nucleotide sequence encoding a TREM-4 or TREM-5 polypeptide.

The TREM-4 polypeptide has a 245 alpha or 222 beta amino acid sequence, see ADD94811. The TREM-5 polypeptide comprises a 269 amino acid sequence, see ADD94812. Also described: (I) a vector containing (I) acid sequence, see ADD94812. Also described: (I) a vector containing (I), operably linked to a heterologous promoter; (4) producing a TREM-4 or TREM-5 polypeptide, (5) preparing a cell or its progeny capable of corressing a polypeptide; (6) an isolated TREM-4 or TREM-5 polypeptide; (7) an antibody which immunospecifically recognises the polypeptide or an antipody which immunospecifically recognises the polypeptide or an antipoda which man aberrant level of TREM-4 or TREM-5, (10) detecting the corresponding fragment of the antibody; (8) an agonist or antigonist of the polypeptide; (9) treating a subject having a disease or disorder corrections for use of TREM-4 or TREM-5, polypeptide in a sample; (11) detecting the presence of TREM-4 or TREM-5 polypeptide in a sample; (12) contraception; or the compound which selectively binds to the polypeptide and a cartier; and (14) a kit comprising a container containing the polypeptide and anti-infertility activities. The nucleic acid (I) is useful for treating a subject having a disease or disorder associated with an aberrant level of TREM-4 or TREM-5 e.g. inflammatory disorder, cancer, infertility or heart disease affecting microvascular compartments. The present sequence or the present invention. Human TREM-5, which is used in an example of from the present invention. Human TREM-5 is located on chromosome 17, more specifically to region 17q25.

New isolated nucleic acid molecule encoding BGS-2, 3 and 4 polypeptides, useful for preventing, treating or ameliorating a medical condition, e.g. a disorder related to aberrant immunoglobulin cell surface receptor WPI; 2003-844480/78. activity.

Example 3; SEQ ID NO 107; 242pp; English

The invention relates to an isolated nucleic acid molecule encoding BGS2, 3 and 4 polypeptides. The nucleic acid molecule, polypeptide and
ectivity are preventing, treating or ameliorating a medical
condition, such as a disorder related to aberrant immunoglobulin cell
condition, such as a disorder related to aberrant immunoglobulin cell
condition activity; a cellular adhesion disorder; a disorder
crelated to hyper- or hypo-immunoglobulin receptor activity, a disorder
crelated to aberrant signal transduction; a reproductive disorder; a
related to aberrant signal transduction; ovarian cancer; sexual
dysfunction; infertility; pelvic inflammatory disease; endometriosis;
premature menopause; placental dysfunction; hormone deficiency; oestrogen
deficiency; aberrant androgen metabolism; polycystic ovarian disease;
cyndrome; hermaphroditism, immune disorders; inflammatory disorders;
syndrome; hermaphroditism, immune disorders; inflammatory disorders;
creminated astronal mediated cytoroxicity; immune reactions to transplanted
crems and tissues; or autoimmunity disorders; autoimmune infertility;
Addison's Disease; haemolytic anaemia; rheumatoid arthritis; dermatitis;
glomerulonephritis; Graves' Disease; Multiple Sclerosis; Myasthenia
creminative inflammatory equence is used in the exemplification of the present invention.

Claim 18 claims primers for use in detecting mutations in a mammalian gene for a structural protein of cartilage comprising a sequence floatified in Table I (Fage 18-31). Table I includes 179 primer sequences (see AAQ65728-Q65906). The following details are given for primer 70: Alt. Code: DH-62 Region/exon: 42/43 Direction: sense Primer position:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 18 claims primers for use in detecting mutations in a mammalian gene for a structural protein of cartilage comprising a sequence identified in Table I (Page 18-31). Table I includes 179 primer sequences (see AAQ65728-Q65906). The following details are given for primer 67: Alt. Code: DH-59 Region/exon: 40/41 Direction: antisense Primer position: 17638 (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting genetic pre-disposition to osteoarthritis - and other diseases involving mutation in cartilage protein genes, by amplification and analysis of DNA and comparison with standards.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Baldwin

                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of determining whether a bacteria is likely to be tolerant to antibiotics. The methods are used for determining bacterial resistance to beta-lactam, penicillin and/or vancomycin. The present sequence represents the S. pneumoniae pep27 PCR
                                                                                                                                                                                                                                                                                                           Determining whether a bacteria is likely to be tolerant to beta-lactam, penicillin or vancomycin by determining the genotype of the vex2 and pep27 genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Sequences AAV62624 to AAV62662 represent oligonucleotides used in the construction and expression of a humanised monoclonal antibody (MAb) LO-CD2a. The invention relates to the use of the MAD LO-CD2a or a humanised or a chimeric version of the LO-CD2a antibody for the inhibition of a T-Phyridoma cell line ATCF (HB 11423) can bind to an epitope on the CD2 antigen of the human lymphocytes. The T-cell mediated immune response in a patient can be inhibited by administering the MAD LO-CD2a or antibody that binds to the same human lymphocytes. The T-cell mediated immune response in a patient can be inhibited by administering the MAD LO-CD2a or an antibody that binds to the same human lymphocyte epitope as LO-CD2a. The method is used for preventing transplant rejection or for treating graftversus-host disease or for treating autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                     Inhibition of T-cell mediated immune response with anti-CD2 monoclonal antibody LO-CD2a - used for preventing transplant rejection or for treating graft-versus-host disease or auto-immune diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents oligonucleotide QARQA which is specific for polynucleotides encoding DNA polymerases from Kaposi's sarcoma herpes virus (KSAPV). The oligonucleotide may be used for detecting viral DNA or RNA in a sample of primate origin, especially in the diagnosis of herpes viral infection. Herpes virus DNA polymerases of this invention, may be used in vaccines for the protection against infection by a herpes virus of the RFHV/KSHV family. They may also be used in the design and screening of anti-viral drugs. Antibodies raised against the polymerase or fragments of it, may be used in the detection of herpes virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Herpes virus DNA polymerase and corresponding nucleotide sequence - used in the detection and treatment of herpes virus infection.

AAV62660,

```
Humanised antibody - comprises complementarity determining region from LO-CD2a, useful to prevent or inhibit graft versus host or auto-immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PCR primers (see AAV22884-95) were used in the PCR amplification of 12 synthetic oligonucleotides used in the construction of a humanised heavy chain (see AAV22854) comprising human Amu 5-3 framework regions and rat anti-CD2 monoclonal antibody LO-CDR2a complementarity determining regions. Primer 51' was used with sense primer 51 (see AAV22892) to join oligonucleotides 9 and 10, and with primer 4H (see AAV22894) to join oligonucleotides 9+10 to oligonucleotides 1-8. Humanised LO-CD2a can be used to inhibit human T cell activation and proliferation, to prevent or

                                                                                 Primers hTSCex4 forward and reverse (see AAV40573 and AAV40574, respectively) are designed to amplify exon 4 of the human hTSC gene (see AAV40561) that codes for thiazide-sensitive Na-Cl cotransporter TSC (see AAW26682). Both primers are located within introns of hTSC. 27 Sets of specific primers (see AAV40565-V40618) were used for SSCP analysis of HTSC. Amplified products were analysed for molecular variants by electrophoresis, and identified variants were sequenced. Complete linkage of Gitelman's syndrome allows for the genetic diagnossis of this disorder. The invention provides products and methods useful for diagnosis and treatment of Gitelman's syndrome and other ion transport
genes - useful for developing products for the diagnosis and treatment of ion transport disorders, e.g. Gitelman's Syndrome or Bartter's Syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polymorphism; human; inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalignatic metaplastic lesion; endometriosis; dysplastic lesion; benign tumnur; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a

Thiazide sensitive cotransporter and ATP sensitive potassium channel

```
precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic cancers, benign tumours, endometritosis, polycyetic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent human polymorphic sites described in the method of the invention

Antibody mediated Inhibition of T cell immune response

Example 7; Col 39; 104pp; English.

PCR primers AAZ10192-93 were used to amplify a fragment of a humanised heavy chain of rat monoclonal antibody LO-CD2a which was synthesised with oligonucleotides AAZ10172-83. LO-CD2a binds to an epitope of a CD2 antigen T-lymphocytes. The humanized LO-CD2a antibody comprises the human constant regions, a light chain framework region derived from a human antibody, a heavy chain framework region derived from a human antibody, heavy and light chain complementarity determining regions (CDRs) of the non-human monoclonal antibody produced by the cell line deposited as ATCC HB11423. The humanised antibodies are used in a method for treating a patient to inhibit a T-cell-mediated immune response. The method is

```
ö
useful for the treatment or prevention of graft rejection and graft-vergus-host disease, as well as in the treatment of autoimmune diseases which are mediated by the activation and proliferation of T cells or natural killer cells

Use of chemokines with a conserved Cys Xaa Cys (CXC) sequence - which do not contain amino acid sequence ELR, for inhibiting angiogenesis in tumours, rheumatoid arthritis, restenosis or glaucoma.

Disclosure; Col 53-54; 145pp; English.

PCR primers AAXIS019-48 were used to amplify nucleic acid sequences encoding CXC chemokines of the invention. These include interferon gammaninducible protein (IP-10), monokine induced by gamma-interferon (MIG), interluekin-8 (IL-8) and IL-10, epithelial neutrophil activating protein-78 (BMA-78), growth related oncogenes alpha, beta amd gamma, platelet factor 4 (PP4), interferon-gamma (IFN-gamma), beta-actin and MIP-2. The specification describes methods for inhibiting anglogenesis or for inducing anglostasis, using chemokines (with a conserved Cys Xaa Cys (CXC) sequence at the N-terminal) other than platelet factor-4, and which

```
do not contain the amino acid sequence ELR. The methods are useful for inhibiting tumour growth and metastasis and for treating diseases such haemangiomas, rheumatoid arthritis, atherosclerosis and idiopathic pulmonary fibrosis (IPP), benign prostatic hypertrophy (BPH), vascular restemosis, arteriovenous malformations (AVM), meningioma, neovascular glaucoma, psoriasis, anglofibroma, heamophilic joints, hypertrophic scars, Osler-Weber syndrome, pyogenic granuloma retrolental fibroplasia, scleroderma, trachoma, vascular adhesions, synovitis, dermatitis, endometriosis, pterygium, diabetic retinopathy neovascularisation associated with corneal injury or grafts, adult respiratory distress syndrome (ARDS), chronic bronchitis, pseudogout and cystic fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 21 BP; 4 A; 6 C; 8 G; 3 T; 0 U; 0 Other;

interferon gamma-inducible protein (IP-10), monokine induced by gamma-interferon (MIG), interluekin-8 (IL-8) and IL-10, epithelial neutrophil activating protein-78, growth related oncogenes alpha, beta and gamma, platelet factor 4 (PF4), interferon-gamma (IFN- gamma), and MIP-2. The specification describes methods for inhibiting angiogenesis or for inducing angiostasis, using chemokines (with a conserved Cys Xae Cys (CXC) sequence at the N-terminal) other than platelet factor-4, and which do not contain the amino acid sequence ELR. The methods are useful for inhibiting tumour growth and metastasis and for treating diseases such as hemangiomas, rheumatoid arthritis, atherosclerosis and idiopathic pulmonary fibrosis (IPF), benign prostatic hypertrophy (BPH), vascular glaucoma, psoriasis, anglofibroma, haemophilic joints, hypertrophic scars, Osler-Weber syndrome, progenic granuloma retrolental fibroplasia, scleroderma, trackhoma, vascular adhesions, synovitis, dermettis, endometriosis, pterygium, diabetic retinopathy neovascularisation associated with corneal injury or grafts, adult respiratory distress syndrome (ARDS), chronic bronchitis, pseudogout and cystic fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ·

Novel biallelic markers used to construct a high density disequilibrium map of the human genome.

Claim 8; Page 1917; 2745pp; English.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ6579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the difficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and atherosclerosis.

Example; Page 88; 242pp; English.

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various belongmost an object of the buran thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences, a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosolerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and unmorary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various bolymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atheroselsenosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPs shown in the specification

This new tissue-specific plant promoter comprises a DNA sequence from Lolium perenne or the nucleotide sequence contained in plasmid plPCCR (DSMZ 14003). The regulatory polynucleotide is useful for manipulating liapin biosynthesis or regulating plants, particularly in tissues such as the stem. This is especially useful for improving digestability of fodder crops, for improving rigidity and permeability of calls walls, or improving resistance to pathogens by improving the lightin content in of plant cell walls. The present sequence represents a 3' RACE (rapid amplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                          New tissue specific plant promoter, specifically for Lolium perenne cinnamoy! COA:NADP oxidoreductase, useful for manipulating lighin biosynthesis in plants or regulating gene expression in lighin-producing tissues of plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, single nucleotide polymorphism, SNP; sickle cell anaemia, agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome;

```
The invention relates to a nucleic acid comprising single nucleotide polymorphisms (SNPs) associated with diseases. The nucleic acids comprising the SNPs and probes and primers for detecting them may be used in assays for the diagnosis of diseases associated with SNPs (such as sickle cell anaemia, agammaglobulinaemia, diabetes insipidus. Lesch-Nyhan syndrome, muscular dystrophy, Miskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolaemia, polycystic kidney disease, hereditary capherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary haemorrhagic telangiectasia, familial acute intermittent porphyra, syndrome, osteogenesis imperfecta, and acute intermittent porphyra, syndrome of successivity to, multifactorial diseases of which a component is or may be genetic, such as autcimmune diseases, including rheumatoid arthritis, multiple sclerosis, diabetes (insulin-dependent and nonindependent), systemic lupus erythematosus and Graves disease, cancers including cancers of the bladder, brain, breast, colon, oseophagus, kidney, leukaemia, liver, lung, oral cavity, ovary, pancreas, prostate, skin, stomach and uterus, longevity, appearance (e.g., baldness, no besity), strength, speed, endurance, fertility, and susceptibility or and in paternity testing. Akk6381-AkK65841 represent human single
muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolaemia, polycystic kidney disease, cancer; hereditary spherocycosis, Von Willebrand's disease, tuberous sclerosis, hereditary baemorrhagic telangiectasia, familial colonic polyposis; Ehlers-Danlos syndrome, osteogenesis imperfecta; autoimmune disease, acute intermittent porphyria; inflammation, nervous system disorder; infection, rheumatoid arthritis, multiple sclerosis, diabetes; systemic lupus erythematosus, Graves disease; longevity, obesity; baldness; fertility; forensic; paternity testing; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid comprising single nucleotide polymorphisms, useful in forensics, paternity testing and diagnosis of disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 21 BP; 2 A; 10 C; 5 G; 3 T; 0 U; 1 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nucleotide polymorphisms of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lander ES

cc mature form of them, or a sequence that is at least 95 % identical to, or having one or more conservative amino acid substitutions in one of the 36 amino acid sequences. The polypeptides, nucleic acid molecules and antibodies of the invention are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a CC MOWA-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnoshing diseases cuch as metabolic disorders, diabetes, obesity, infectious diseases cuch as metabolic disorders, diabetes, obesity, infectious diseases coviral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer associated cachexia, meunod egenerative disorders, Alzheimer's disease, parkinson's disease, immune disorders, haematopoietic disorders, cancer and various dyslipidaemias, or metabolic disturbances associated with obesity, metabolic x syndrome, and wasting disorders. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell confidencially to NoVX substances for use in therapeutic or immunospecifically to NoVX substances for use in therapeutic or immunospecifically to NoVX substances for use in therapeutic or probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. This polyfuclectide represents a NoVX related reverse continuer of the invention \$

Strieter RM, Polverini PJ,

Inhibition of angiogenesis in human having tumor, by administering to human, composition comprising recombinant adenovirus having nucleic acid WPI; 2003-327304/31.

Kunkel SL;

the invention relates to an angiogenesis inhibited by administering to a human having a tumour, a composition comprising a recombinant adenovirus that encodes an one that comprises and expresses a nucleic acid segment that encodes anon-size. CCC (Glu-Leu-Arg, Cys-Xaa-Cys) chemokine other than platelet factor 4 (PF4). The non-BLR CXC chemokine lacks the amino acid sequence BLR e.g. 1P-10 or a CXC chemokine protein where the ELR sequence BLR e.g. than 1Y or DLQ. The method is for inhibiting angiogenesis. It is also useful for treating benign tumours, haemangiomas, rheumatoid arthritis, atherosclerosis, idiopathic pulmonary fibrosis, PRF, (Benign prostatic hypertrophy or hyperplasis), vascular restenosis, arteriovenous malformations, meningioma, neovascular glaucoma, psoriasis, angiofibroma, haemangioma retrolental fibrophis scars, osleweber syndrome, pyogenic chaemophilic joints, hypertrophic scars, osleweber syndrome, pyogenic adhesions, synovitis, dermatitis, or endometriosis. It is also useful in adhesions, synovitis, dermatitis, or endometriosis. It is also useful in the sorial and error angiogenic or angiostatic chemokines to be identified or designed without laborious experimentation and avoiding the expense of trial and error screening. It inhibits or reduces angiogenesis in the animal or in a defined biological site within the animal. The present sequence is a conservation of the process transcriptus experiment used to detect CXC chemokine segment that encodes chemokine other than platelet factor. Strieter RM, Polverini PJ,

```
the invention relates to an angiogenesis inhibited by administering to a human having a tumour, a composition comprising a recombinant adenovirus that encodes a non-spresses a nucleic acid segment that encodes a non-birack (Glu-Leu-Arg, Cys-Kaa-Cys) chemokine other than platelet factor (PF4). The non-ELR CXC chemokine lacks the amino acid sequence Elx e.g. IP-10 or a CXC chemokine protein where the ELR sequence has been replaced with TVR or DLQ. The method is for inhibiting angiogenesis. It is also useful for treating benign tumours, haemangiomas, rheumatoid arthritis, atherosclerosis, idiopathic pulmonary fibrosis, BPH, (benign prostatic hypertrophy or hyperplasia), vascular restenosis, arteriovenous malformations, meningioma, neovascular glaucoma, psoriasis, angiofibroma, haemophilic joints, hypertrophic scars, oslerweber syndrome, pyogenic granuloma retrolental fibroplasia, scleroderma, trachoma, vascular adhesiong, synovitis, dermatitis, or endometriogis. It is also useful in wound or sore healing, treatment of vascular grafts or transplants, and treatment of skin, gastric, or duodenal ulcers. The invention allows angiogenic or angiostatic chemokines to be identified or designed without screening. It inhibits or reduces angiogenesis in the animal or in a control of the present sequence is a submander of the control of the present sequence is a process.
                                                      Inhibition of angiogenesis in human having tumor, by administering to human, composition comprising recombinant adenovirus having nucleic acid segment that encodes chemokine other than platelet factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               defined biological site within the animal. New virus suppressing factor protein having antiviral activity produced

The invention relates to a virus suppressing factor (VSF) protein increasingly produced in an immune cell stimulated by encephalomyocarditis virus variant. The protein has antiviral activity unchanged by immunoprecipitation and immunoneutralisation, is inactivated by proteinase K, is not chosen from antiviral cytokines. The invention is useful for preventing or treating viral infections by administering the protein to a subject suffering from a viral infection. The invention has antiviral activity which is to suppress proliferation or replication of a virus belonging to Orthomyzoviridae, Picornaviridae, Retroviridae or Werpes. The present sequence is a RT-PCR primer used in the amplification of cytokines of the invention ö for suppressing proliferation or replication of virus e.g. herpes virus in immune cell stimulated by encephalomyocarditis virus variant, useful Gaps .. 0 1.7%; Score 13.8; DB 1; Length 21; 88.2%; Pred. ```
The present invention relates to a method of inhibiting angiogenesis. The method comprises administering to an animal, preferably human, a composition that comprises chemokines other than platelet factor 4 (PF4), composition that comprises chemokines other than platelet factor 4 (PF4), composition that comprises chemokines other than platelet factor 4 (PF4), ce.g. interleukin-8 (IL-8), gamma interferon-inducible protein-10 (IP-10), ce.g. interleukin-8 (IL-8), gamma interferon (MIG), epithelial controphil activating protein-78 (ENA-78), granulocyte chemotactic neutrophil activating protein-78 (ENA-78), granulocyte chemotactic protein (PBP) such as connective tissue activating protein-III (CTAP-CT protein (PBP) such as connective tissue activating protein-III (CTAP-CTII), beta-thromboglobulin (betaTG) and neutrophil activating peptide-2 (NAP-2). The method is useful for inhibiting angiogenesis in humans, and is useful for treating tumours and even sarcomas of the lung, ovary, pancreas, stomach, and prostate. The method is also useful for treating comes, recumatoid arthritis, atherosclerosis, idiopathic pulmonary commensions, recumber syndromes propertions (IBroplasais, scleroderma, trachome, pyogenic granuloma contraction and prometris, areachema, vascular adhessions, cynovitis, dermatitis and endometriosis. Also disclosed are methods for inducing angiosesis, stimulating angiogenesis, and promoting wound the process.
                                                  Inhibiting angiogenesis, by administering a pharmaceutical chemokine composition that comprises a chemokine other than platelet factor 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 21 BP; 4 A; 6 C; 8 G; 3 T; 0 U; 0 Other;

The present invention relates to a method of inhibiting angiogenesis. The method comprises administering to an animal, preferably human, a biological amount of a pharmaceutical CXC (Cye-xaa-Cye) chemokine composition that comprises chemokines other than platelet factor 4 (PF4), e.g. interleukin-8 (IL-8), gamma interferon-inducible protein-10 (IP-10), the growth related oncogene (GRO) peptides GROalpha, GRObeta, and GROgamma, monokine induced by gamma interferon (MIG), epithelial captores in a chemote by gamma interferon (MIG), epithelial activating protein-2 (GCP-2), and the NN2-terminal truncated forms of platelet basic protein (PBP) such as connective tissue activating protein-III (CTMP-III), beta-thromboglobulin (betaTG) and neutrophil activating peptide-2 (MP2-1). The method is useful for inhibiting angiogenesis in humans, and is useful for treating tumours and even sarcomas of the lung, ovary, pancreas, stomach, and prostate. The method is also useful for treating tumours and even sarcomas of the lung, ovary, pancreas, stomach, and prostate. The method is also useful for treating fibrosis (IPP), vascular restenosis, arteriovenous malformations (AVM), meningioma, neovascular glaucoma, psoriasis, angiofibroma, haemophilic cours, proteins, hyportrophic scars, soleroderma, trachoma, vascular adhesions, syncolutis, dermatitis and endometriosis. Also disclosed are methods for inducing angioseasis, stimulating angiogenesis, and promoting wound healing. The present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present invention describes a predictor set comprising a plurality of polymucleotides or polypeptides whose expression pattern is predictive of the response of cells to breatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase activity or members of the protein tyrosine kinase condutating the activity of cells, comprising obtaining a sample of cells, concellating the activity of cells, comprising obtaining a sample of cells, correlating whether the cells, comprising obtaining a sample of cells, correlating the expression of the markers to the compound's ability to correlate the activity of the cells, (2) a plurality of cells innes for identifying polymucleotides and polypeptides whose expression levels correlate with compound sensitivity or resistance of cells associated with a disease state, omprising subjecting the plurality of associated with a disease state, comprising subjecting the plurality of associated with a disease state, omprising subjecting the plurality of an increarray of polymucleotides that predict compounds, analysing the expression pattern of cells associated with a disease state by using the compounds that interact with polymucleotides and polympeptides that predict activities, and can be used in gene therapy. Compounds that interact with polymucleotides and polypeptides are useful in predicting to any protein tyrosine kinase pathways. These may be used in determining drug cativity of compounds that interact with polymucleotides and cativity of compounds that interact with polymucleotides and cativity of compounds that interact with polymucleotides and cativity of compounds that interact with polymucleotides and cativity of compounds that interact with polymucleotides and cativity of compounds that interact with polymucleotides and cativity of compounds that interact with polymucleotides and cativity of compounds that interact with present investing the administration of the present invention.

Compounds the interaction of the pre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      d
```

The invention comprises a human antibody for inhibiting platelet aggregation by its exclusive binding to the activated state of platelet integrin receptor GPID/IIIa. The antibody of the invention is useful for preparing a diagnostic composition for determining the number of activated thrombocytes or for blocking the platelet integrin receptor on thrombocytes. The antibody of the invention is useful for treating thrombosis or myocardial infarction. The present DNA sequence represents it PCR primer that was used in an example of the invention.

New antibody, useful for preparing a composition for determining the number of activated thrombocytes or for blocking the platelet integrin receptor on thrombocytes for treating e.g., thrombosis or myocardial

Example 1; SEQ ID NO 28; 80pp; English.

infarction.

                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                      В
                                                                                                                                                                                                                                        ઠે
                                                                                                        The invention relates to genetic variants of the homeo box D3 (HOXD3) gene. HOXD3 gene includes 9 polymorphic sites PS1-PS9. Haplotypes (HTS) or haplotype pairs (HP) for PS1-PS9 in the HOXD3 gene are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with HOXD3 activity, e.g., developmental disorders and tumours. HOXD3 ascociated with expressing HOXD3 protein for use in screening for candidate drugs to treat diseases related to HOXD3 activity of HOXD3 and in expressing HOXD3 protein for use in screening for candidate drugs to the variation on the biological activity of HOXD3 as well as on the binding affinity of candidate drugs targeting HOXD3 as well as on the binding affinity of candidate drugs targeting HOXD3 as well as on the binding affinity of addidate drugs targeting HOXD3 as well as on the binding affinity of addidate drugs targeting HOXD3 as well as on the binding affinity of addidancers and tumours. An antibody against HOXD3 is useful in a variety of diagnostic and prognostic formats and therapeutic methods. A recombinant non-human organism is useful in studying expression of the HOXD3 isogenes in vivo. Allele-specific oligonuclectides (ASO) are useful as probes and primers and for assaying a polymorphism in the target region. The present sequence is an ASO primer used for detecting human HOXD3 gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                         New genetic variants of Homeo Box D3 for studying expression and function of the protein, and for screening drugs to treat diseases e.g. developmental disorders and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              numan; endothelial differentiation, G-protein coupled receptor 6; EDG6; haplotype; cancer; angiogenesis; inflammation; chromosome 19pl3.3; cytostatic; antiinflammatory; gene therapy; SNP; single nucleotide polymorphism; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New genetic variants of endothelial differentiation, G-protein coupled receptor-6 gene for studying expression, function of the gene and expressing EDG6 protein for use in screening drugs to treat cancer, inflammation.

Analysis of of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (NCR) (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence the same degree different is pind, ognetically different to type 1 and 2. The same degree different is into was noted in the NS-5 (see AAR37931) between type 3 and type 1 sequences. (Updated on 25-MAR-2003 to correct
                                                           The present invention provides the gene, protein and cDNA sequences of the human endothelial differentiation, G-protein coupled receptor 6 (EDG6). Also identified are single nucleotide polymorphisms (SNPs) found within the sequences. The sequences can be used in the identification of the haplotype of an individual, and in the treatment of cancer, angiogenesis and inflammation. The present sequence is an allele specific primer for the EDG6 gene, which is found on chromosome 19pl3.3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA encoding antigenic peptide(s) of new types of hepatitis C virus - for diagnosing and treating HCV infection, screening blood samples and identifying different HCV types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Non-coding region; hepatitis C virus; blood donor; type 2; type 1; HCV; NS-5; phylogeny; differentiation; NS-3; core region; type 3; PCR; amplify; polymerase chain reaction; primer; NS4; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                          Sequence corresp. to fragment of Peptide I of light subunit of rat gammaglutamylcysteine synthetase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gamma-glutamylcysteine synthetase (GCS) purified from rat kidney subcates under denaturing conditions to yield two nonidentical subunits a heavy subunit of Mr - 73,000 and a light subunit of Mr - 27,700. The purified light subunit was reacted with trypsin and Edman degradation was carried out. The sequence of two apparently homologous peptides were obtd. The AA Reguence of the peptides obtd. - Peptide I & Peptide II - are given in AAR63239 & AAR63240. An oligo probde was Peptide and synthesised corresp. to the sequence deduced from Peptide I. The mRNA sequence corresp. to the sequence deduced from Peptide I. AAQ77981, and the determined DNA sequence is AAQ77983. The probe is AAQ77981, and the determined DNA sequence is AAQ77983. The probe is derived from Peptide I. Deoxyinosine was substd. at the wobble posns in two of the codons. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gamma-Glutamylcysteine synthetase light subunit - and cDNA coding for it, potentially useful for gene therapy.

AAQ94680 is a 20-mer from the rat neu promoter, which contains the human and rat neu promoter consensus sequence TGGAATG, a putative target sequence for BIA-induced cell transformation repression. BIA-induced repression can be used to suppress cancer cells (esp. breast and ovarian cancer cells), and adenoviruses

Sequences were determined from the ends of chromosome 11-specific cosmids by automated sequencing without intermediate subcloning. A sample of 371 DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer analysis (using the "Primer" program available from E.Lander, MIT). The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated most of them were regionally mapped. This procedure illustrates a novel method for sequencing complex genomes, designated "sequence sampled mapping method is useful for the completion of high density sequence-based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones. See
                                                                                                                                                                                                                               Sequencing complex genomes, present as fragments in a cosmid library - k sequencing end-specific nucleotides of each clone then correlating with spatial relationship of cosmid, esp. for mammalian chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Alaserpin; serpin; serine protease-inhibitor; elastase-inhibitor; chymotrypsin-inhibitor; plant protectant; insect resistance; crop improvement; transgenic plant; alfalfa; Medicago sativa; Manduca sexta; primer; PCR; polymerase chain reaction; ss.

The GS sequences (T19001-T26837) were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Bach library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was
                                                                                                                                                                                                      PCR primers given in AAQ97487-88, corresp. to nt. 73-92 and 835-854 of M. sexta alaserpin cDNA (AAQ97486) respectively, were used to generate a 782 bp PCR fragment used as a DNA probe for the M. sexta alaserpin gene in transgenic alfalfa plants. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                   Transgenic plant containing novel serine protease inhibitor gene of M. sexta - provides protection for the plant against attack by insects, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Single-stranded DNA for identifying gene signatures - isolated from 3'-directed human cDNA library that reflects relative abundance of corresp

Amplified fragments were manipulated into pGEX vectors for production of GST-HEV antigen fusion proteins in E. coli. (Updated on 25-MAR-2003 to correct PN field.)
derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. The primers T41181-2 amplify clone pm2369 which comprises the GS HUMGS001015 (T20015), located on chromosome 17

Oligo:nucleotide(s) targetted to nucleic acids encoding human raf capable of inhibiting raf expression, used in treatment of hyper:proliferative disorders.

Disclosure; Page 22; 65pp; English.

```
AAT27508-T27520 are human A-raf kinase antisense oligonucleotides used for the inhibition of raf expression. Human A-raf is expressed in ucoganital tissues. The oligonucleotides (ONs) are targeted to either coding region, stop signal or 5' or 3' untranslated region (UTR) mRNA encoding human A-raf. The ONs are phosphorothioate linked. The ONs are used to inhibit expression of human raf in partic. in conditions associated with hyperproliferation e.g. cancer, restenosis, and psoriasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chemokine receptor 88-2B; rheumatoid arthritis; tumour; atherosclerosis; asthma; viral infection, ADS; inflammation; autoimmune disease; therapy; diagnosis; leukocyte trafficking; G protein coupled receptor; macaque; polymerase chain reaction; PCK; primer; ss.

```
Primers AAT96998-T97044 are used to detect alternative splice variants of the human presentlin-2 (PS-2) gene from different tissues e.g. brain, heart, liver, lung, placenta and skeletal muscle. Primers AAT97024-T97044 are derived from intronic sequences. The primers used to detect the splice variants can be used to diagnose Alzhaimer's disease, particularly in Volga-Germans (a culturally distinct subpopulation in Russia). The PS-2 gene variants can also be used in the creation of transgenic animals

                                                                                                                                                                                                                                                                                                    5' Primer 88-2B-f1 (AAT85170) corresponds to the sense strand of human chemokine receptor 88-2B cDNA (see AAT85162) at nucleotides 844-863. 3' Primer 88-2B-r1 (AAT85171) corresponds to the antisense strand at nucleotides 1023-1042. The primers were used in the PCR amplification of human macrophage cDNA, yielding clone 777, a full-length cDNA clone of 88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Variant presenilin-2 gene - useful for diagnosis of Alzheimer's disease.
                                                                                                                                                                                                                 New nucleic acid encoding chemokine receptors 88-2B and 88C - used to modulate leukocyte trafficking, e.g. for treatment of inflammation, tumours, viral infections, auto-immune diseases, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

This is a 5' PCR primer used in the amplification of a 846 base pair fragment corresponding to the type I interleukin-1 receptor (ILIR) bases 190-1036. The amplification product was identified as human type ILIR probe, and used to show areas of ILI protein expression. Expression of ILIR, in cells and tissues can be modulated by compositions comprising sugar-modified oligomers which are able to specifically hybridise with target areas of its encoding sequence. The composition can be used for treatment of disease in humans caused by excessive receptor expression, eq. inflammation. When labelled they can be used diagnostically to determine overexpression of ILIR, also to determine localisation and distribution of this expression for research, diagnostic or therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2^\prime-\mathrm{substituted} oligonucleotide(s) specific for interleukin-1 receptor type I - used to modulate expression and detect overexpression of the receptor.
                                                                                                                                                                                                         Type I interleukin-1 receptor; ILIR; human; probe; ILI protein; PCR; sugar-modified oligomer; hybridisation; inflammation; primer; amplification; ss.

PCR primers AAX04561-72 were used to amplify cDNA encoding MCG7. The MCG7 protein has gene regulatory functions, and has homology to a heat shock protein or heat shock-binding protein. The specification also describes MCG4, which is homologous to guanine nucleotide exchange factor protein, and MCG18, which is homologous to a zinc finger protein. Detection of mutations in the MCG genes can be used to oidentify the propensity for various types of cancer, and to treat, arrest, or otherwise ameliorate, the effects of a cancer in an animal or bird

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligonucleotides targeted to human raf mRNA useful for treating and diagnosing abnormal proliferative states and inhibiting raf expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides antisense oligonucleotides targeted to mRNA encoding human raf and capable of inhibiting raf expression. The antisense oligonucleotides are useful for treating and diagnosing abnormal proliferative states and hyperproliferation (e.g. cancer, psoriasis, or blood vessel restenosis), and inhibiting raf expression. Sequences AAZ11538-550 represent antisense oligos for human A-raf

                                                                                                                                                                                                                                         Cor detecting and/or identifying human papillomavirus (HPV) present in a biological sample. The method comprises amplification of a polymucleic acid fragment of HPV using a 5. primer specifically hybridizing to the A region or B region of the genome of at least one HPV type, and 3. primer specifically hybridizing to the C region of at least one HPV type, and phyridization of the amplified fragments with at least one HPV type. The primers individually or as a combination of at least one HPV type. The primers individually or as a combination of 5. primer and 3. Primer, and the probes are used in the detection and/or identification of HPV present in a biological sample. An isolated HPV polymucleotide, or fragment, can also be used as primer in a method for detection and/or identification of HPV present in a sample. Identification of the importance. The presence of high-risk HPV types is a prognostic marker importance. The presence of high-risk HPV types is a prognostic marker for development and detection of cervical cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

                                                                                                  PCR primers AA201426-206209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AA201425). These ORFs anchode polygeptides (see AA36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachom, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis, gentral diseases such as nongonococcal uretritis, engiquentis, cervicitis, allipsisis, perihepatitis, bartholinitis, penumopathy in breast feeding infants, and venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vaccine, eye disease, conventional trachoma, nonendemic trachoma, paratrachoma; inclusion conjunctivitis; genital disease, perihepatitis, nongonococcal uretritis, epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; veneral lymphogranulomatosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0
pagainst Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microoraganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases auch as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion epidymitis; genital diseases such as nongonococcal uretrits, epidal diseases such as nongonococcal uretritis, epidymitis, carloinis, perihepatitis, bartholinitis; phenomopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           or 2'

Sequences AA231067-231076 (excluding AA231071) are antisense oligonucleotides that are complimentary to regions of the human HER-2 nucleotide sequence AAZ31071. This oligonucleotide is complimentary to nucleotides sequence AAZ31071. This oligonucleotide is complimentary to nucleotides 1419-1438 of the HER-2 sequence, and targets the coding transmembrane receptor, with tyrosine kinase activity, HER-2 is related to the epidermal growth factor receptor (EGFR or HER-1). Aberrant HER-2 expression is present in a wide number of cancers, especially breast, ovarian and gastric cancers. This sequence is used in the invention to design 12-25 nucleotide oligonucleotides that decrease the expression of modulating the expression of the invention can also be used for modulating the expression of the invention can also be used for modulating the expression of the invention can also be used for modulating the expression of the invention can also be used for modulating the expression of the invention can also be used for modulating the expression of the invention can also be used for modulating the expression of the invention can also be used for modulating the expression of the invention to also be used for modulating the expression of the invention to also be used for modulating the expression of the invention to also be used for modulating the expression of the invention to the end with the expression of the expression of the end of the expression of the expression of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the end of the en
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae ganome (see AAX34584- AAX3689) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (See AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema rodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34584-AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                 Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                   Gaps
nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                        AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent critis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34894 - AAX3879) can be used nuclectides sequences can also be used as immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX21990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34884- AAY3689) can be used in immunogenic compositions as vaccines. Vectors containing C pneumoniae especially where the vector directs the expression of a neutralising epitope of C pneumoniae
                                                                                                                                                                          AAX91991-X97517 represent PCR primers used to amplify open reading frames
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New variant forms of the human parkin gene, used as source of primers and
probes for detecting susceptibility to Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR primers AAA46778-79 were used to detect an insertion of the nucleotides GT between positions 321 and 322 in exon 3 of the human parkin protein gene. The specification describes a parkin gene which has genetic alterations. Cells, or transgenic animals, that express the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                             AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY3484- AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, so be used as immunogenic compositions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

altered parkin gene are used to screen for compounds that can counter the effects of a genetic alteration in the parkin gene, or more generally for studying the properties of the parkin protein. Detection of the specified alterations is used to diagnose susceptibility to Parkinson's disease. The modified polymucleotide is also used to express the corresponding protein, which is then used to screen for potential anti-Parkinson agents
                                                                                                                                                                                              and to raise antibodies (for detecting variants of parkin protein)

Antisense oligonucleotides targeted to nucleic acids encoding human tumor necrosis factor receptor-associated factor (TRAF), useful for treating diseases associated with TRAF expression such as inflammatory diseases.

Example 16; Page 51; 170pp; English.

The present invention relates to antisense oligonucleotides (see AAA55496 -A55757) which are targeted to nucleic acids encoding a human tumour necrosis factor receptor-associated factor (TARF). The antisense comprise at least one modified internucleotide linkage, which is a phosphorothioate linkage. The oligonucleotides also include at least one modified sugar moiety winch as a 2'-O-methoxyethy! sugar moiety. Sequences AAA55490-A55495 represent nucleotide sequences encoding human TRAF1-6. Included in the invention is a method for treating a human having a disease associated with the expression of TRAF comprising administering an antisense oligonucleotide. The reduction of jun kinase activation in cells comprises contacting the cells with an antisense oligonucleotide targeted to TRAF-6. A method for the reduction of E-cissues with an antisense oligonucleotide targeted to TRAF-6. The antisense oligonucleotide targeted to TRAF-6. The antisense oligonucleotide targeted to TRAF-6. The antisense oligonucleotide targeted to TRAF-6. The antisense oligonucleotide fargeted to TRAF-6. In the antisense oligonucleotide targeted to TRAF-7 or TRAF-6. The antisense oligonucleotide fargeted to TRAF-6. The antisense oligonucleotide fargeted to TRAF-7 or TRAF-6. The antisense oligonucleotide for the antisense oligonucleotide with cell proliferation and inflammation. The antisense oligonucleotides with cell proliferation and inflammation. The antisense oligonucleotides with cell proliferation and inflammation. The antisense oligonucleotides with cell proliferation and inflammation. The antisense oligonucleotides associated with cell proliferation and inflammation. The antisense oligonucleotides associated with cell proliferation and inflammation. The antisense oligonucleotides as a diagnostic probe for studying gene function

Antisense oligonucleotides for inhibiting microtubule-associated protein 4 expression, useful in treating disorders associated with microtubule protein expression.

Example 15; Col 40; 39pp; English.

This sequence represents an antisense oligonucleotide targetted against the gene encoding human microtubule-associated protein 4 (MAR4). Inhibition of MAR4 expression was measured by determination of MAP4 mRNA levels in a variety of cell lines via real-time quantitative PCR. The cell lines used included the bladder carcinoma cell line T-24, the human lung carcinoma cell line A549, human neonatal dermal fibroblasts and human embryonic keratinocytes. Microtubule-associated proteins comprise a group of proteins that mediate microtubule assembly and function which is

required for cytoskeletal integrity. MAP4 is a member of the non-neuronal structural MAP family and is believed to affect microtubule dynamics by stabilising the microtubule lattice. MAP4 expression has been shown to be elevated in cells with mutant p53 oncogene expression, and is therefore linked to cancer chemotherapeutic drug sensitivity. These antisense microtubes are useful for treating animals, parktudarly humans, having or being prome to a disease or condition associated with the expression of MAP4. The oligonucleotides are also useful for research and diagnostic

AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and dispostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel biallelic markers used to construct a high density disequilibrium map of the human genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human biallelic marker upstream amplification primer SEQ ID NO:7672.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human genome; biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; amplification; SNP; PCR primer;

The present invention describes a learning-induced kinase, designated KKIAMRE kinase, isolated from rabbit brain tissue. KKIAMRE kinase is a cdc2-related kinase. The KKIAMRE kinase is a becade to express recombinant protein for analysis, characterisation or therapeutic use, as markers for tissues in which the protein is preferentially expressed, as molecular weight markers on Southern gels, as chromosome markers or tags, to compare endogenous DNA sequences in patients to identify potential genetic disorders, as probes to hybridise and discover onvol related sequences, as a source of PCR primers, and as an antigen to induce anti-DNA antibodies. The polypeptides can be used in assay to discover biological activity, to raise antibodies, as tissue markers, and to isolate correlative receptors or ligands. The polymucleotides may also be used for gene therapy for the treatment of disorders which are mediated by KKLAMRE kinase. The present sequence represents a PCR primer for rabbit neurofilament-L (NP-L), which is used in an example from the
                                                                                                        ;

                                                                              This invention describes novel human RET proto-oncogene variants which have cytostatic activity. The proto-oncogenes are used to identify despitations to forms of disturbance or idiopathic obstipation, to determine disposition for multiple endocrine neoplasia syndrome type 2A, familial medullary thyroid gland carcinoma, central breathing regulation of disorder, in particular undine syndrome or sudden infant death. They can be used to characterize and detect homozygous variants for position 135A of RET proto-oncogene, optionally with other genetic characteristics. Heterozygous variants, e.g. containing a variants in the cysteine rich region of RET (i.e. position 1825) and at position 135A, can be continued a variant of in the cysteine rich identified. The sequence variants can be used for development of therapeutics, sepecially new classes of therapeutics, targeted to the containing or promoter and characteristics or individually optimize therapy or intervention targeted to the Ret receptor tyrosine kinase. The sequences can be used to construct vectors, in particular to develop pharmaceutically relevant agents and for develop in vitro, preferably in cell culture, and in vivo, transgenic confidences in vitro, preferably in cell culture, and in vivo, transgenic animals and teet systems; for expression of individual forms of the human RET proto-oncogene, where the test system is used to look at the parametric parametric confidence and general medical characteristics associated the human RET proto-oncogene and to develop and test individually specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human RET proto-oncogene variants for determining disease disposition and tailoring specific individual therapies, for e.g. multiple endocrine neoplasia syndrome type 2A or for familial medullary thyroid gland
                                                                                                                                                                                                                             RET proto-oncogene; human; primer; cytostatic; obstipation; multiple endocrine neoplasia syndrome type 2A; undine syndrome; familial medullary thyroid gland carcinoma; sudden infant death; central breathing regulation disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1.6%; Score 13.6; DB 1; Length 20; 80.0%; Pred. By incorporating the pyruvate carboxylase gene in expression vectors levels of expression can be 2 - 20 fold higher than in Corynebacterium glutamicum. Seven primers (AAA47536-42) were used to the pyruvate carboxylase ocding sequence which was inserted into cosmid IIFIPI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The present invention relates to methods for producing human mitotic kinesin proteins which comprise a motor domain. The method involves expressing a human mitotic kinesin coding sequence in a bacterial cell and substantially purifying the protein product. The human mitotic kinesins are useful in screening assays, for generating polyclonal and monoclonal antibodies that are useful as blocking peptides and in therapeutics. In addition, the kinesins also permit drug designing are used in screening assays for compounds that modulate kinesin activity. The present sequence is a PCR primer used in the present invention to amplify the human mitotic kinesin coding sequences, which were used in the present invention
                                                                                                                                                          Producing human mitotic kinesin protein excluding Kid comprising motor domain useful in screening assays, involves expressing nucleic acid encoding the protein in bacterial cell and purifying the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1.6%; Score 13.6; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  a-raf is a serine-threonine-specific protein kinase and is thought to play a fundamental role in signal transduction, and cell proliferation control. The present sequence is an antisense oligonucleotide. This sequence is targeted to human a-raf gene, resulting in a-raf expression inhibition. The present sequence may be useful for treating and raf-sociated cell hyperproliferation conditions such as cancer, hyperplasias, pulmonary fibrosis, angiogenesis, pscriasis, atherosclerosis and smooth muscle cell proliferation in blood vessels egg stennosis or restenosis following angioplasty. Also, the present sequence may be useful for treating inflammatory disorders such as tissue graft rejection, endotoxin shock and glomerular nephritis
signal transduction; hyperplasia; pulmonary fibrosis; angiogenesis; psoriasis; atherosclerosis; smooth muscle cell proliferation; stenosis; restenosis; inflammatory disorder; tissue graft rejection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense oligonucleotides targeted to nucleic acid molecule encoding human raf useful for diagnosis, treatment of raf-associated cell proliferative conditions such as cancer, psoriasis or blood vessel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

This invention relates to antisense compounds 8-30 nucleobases in length targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic acid encoding a p38 mitogen activated protein kinase (MAPK), where the acid encoding a p38 mitogen thuman p38alpha MAPK Sequences aAC79510 represent human p38alpha MAPK Sequences and 54C79510 represent human p38alpha mapK and p38bena MAPK CDNA sequences. AAC79481 - AAC79500 and AAC79553 - AAC79570 represent human p38alpha mapK sequence and p38alpha antisense oligonucleotides, while AAC79570 represent human p38abet antisense oligonucleotides AAC79523 - AAC79571 and antisense oligonucleotides AAC79523 - AAC79573 and antisense oligonucleotides AAC79523 - AAC79573 and antisense oligonucleotides have antisheumatic; antiarthritic; immunosuppressive; cardiant and antisheumatic; antiarthritic; immunosuppressive; cardiant and antisheumatic; antiarthritic; oligonucleotides are useful for inhibiting the expression of p38 MAPK in cells or tissues. The oligonucleotides are used for treating an animal with diseases such as inflammatory or autoimmune diseases e.g. rheumatoid arthritis, or heart disease. The oligonucleotides are also useful for inhibiting inflammation or apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, glycogen synthase kinase 3 alpha, antidiabetic, cytostatic, antisense therapy, diabetes; hyperproliferative disorder; inflammation, neurological disorder; tumour; haematopoietic disorder; infection; hyperproliferative disorder; developmental disorder; antisense; phosphorothioate backbone; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human glycogen synthase kinase 3 alpha antisense oligo ISIS #116670
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .;

The antisense compound specifically hybridises with and inhibits the expression of glycogen synthase kinase 3 alpha. The antisense compound is useful for the treatment of a diseases associated with glycogen synthase kinase 3 alpha such as diabetes, a neurological disorder. A haematopoietic disorder, a hyperproliferative disorder or a developmental disorder. The antisense compounds may also be used prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence is a phosphorothicate antisense oligonucleotide targetted to human glycogen synthase kinase 3 alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense compound 8 to 30 nucleobasės in length comprising a compound that is targeted to a nucleic acid molecule encoding glycogen synthase kinase 3 alpha, useful for the treatment of e.g. diabetes and hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human glycogen synthase kinase 3 alpha antisense oligo ISIS #116646.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

Antisense compound 8 to 30 nucleobases in length comprising a compound that is targeted to a nucleic acid molecule encoding glycogen synthase kinase 3 alpha, useful for the treatment of e.g. diabetes and hyperproliferative disorders.

Example 15; Page 83; 115pp; English.

The invention relates to an antisense compound 8 to 30 nucleobases in length targetted to a nucleic acid encoding glycogen synthase kinase 3 alpha. The antisense compound specifically hybridises with and inhibits the expression of glycogen synthase kinase 3 alpha. The antisense compound is useful for the treatment of a diseases associated with glycogen synthase kinase 3 alpha such as diabetes, a neurological disorder, a haematopotetic disorder, a hyberproliferative disorder or a developmental disorder. The antisense compounds may also be used prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence is a phosphorothioate antisense origonucleotide targetted to human glycogen synthase kinase 3 alpha

The specification describes a composition for quantifying or detecting one or more target nucleic acids in a sample. The composition comprises one or more detectably labeled oligonucleotides, where one comprise or or more detectable labels located internally and/or at, or near the 3' and/or 5' termini and the label undergoes a detectable change in an observable property upon becoming part of a double stranded molecule. The oligonucleotides are useful for detecting or measuring the products of nucleic acid amplification reactions and in the discrimination between alleles of a given target gene. They are also useful for detecting the presence or absence, or for quantity the amount of nucleic acid molecules in a sample without the need for performing amplification or synthesis in a sample without see also useful in methods for diagnosing infectious diseases and genetically inherited diseases. PCR primers AAFV4575-82 were used in the compositions of the invention to amplify and detect the 1.6%; Score 13.6; DB 1; Length 20; 80.0%; Pred. The invention relates to antisense oligonuclectides 8-30 nuclectides in length targeted to a nucleic acid molecule encoding macrophage migration inhibitory factor (MMIF), where the antisense compound specifically hybridizes with and inhibits the expression of MMIF. The antisense nucleotides are useful for the treatment of a disease or condition associated with MMIF such as neurological, hormonal, immune, inflammatory or hyperproliferative disorder. Sequences AAH21191-268 represent chimeric antisense phosphorothioate oligonucleotides used for inhibition of human MMIF mRNA expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense compound(s) are useful to inhibit a nucleic acid molecule encoding macrophage migration inhibitory factor.

Human PEPCK-cytosolic antisense oligonucleotide ISIS 108034.

Human, antiinflammatory, cytostatic, antisense gene therapy, phosphoenol pyruvate carboxykinase-cytosolic, PEPCK-cytosolic, infection; inflammation; tumour formation, phosphorothioate; ss.

The present sequence is one of a number of antisense compounds of up to phosphoenol pyruvate carboxykinase—cytosolic (PBPCK-cytosolic). The antisense compounds are useful for inhibiting the expression of percept compounds are useful for inhibiting the expression of PEPCK-cytosolic in cells or tissues. They are commonly used as research reagents and in diagnostics, e.g. to elucidate the function of particular genes. They are also useful for distinguishing between functions of various members of a biological pathway and for research use. The antisense compounds are also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence is a chimeric phosphorothioate oligonucleotide with 2'-MOE wings and a Antisense compound capable of modulating the expression of phosphoenol pyruvate carboxykinase-cytosolic, useful for preventing or delaying infection, inflammation or tumor formation. New human poly(ADP-ribose) polymerase for treating inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders, such as, arthritis, encephalitis, myocardial ischemia, and leukocyte metastasis.

Example 3; Page 78; 129pp; English.

The sequences given in AACB5321-40 and AACB5342-51 are primers which were expression of the function of bacultovirus expression vectors for the expression of the fusion protein PARP12. This protein contains amino acids 1-66 of hPARP1 flued upstream of amino acids 230-583 of PARP2. The fusion protein coding sequence is given in AACB5341. The protein of the invention, hPARP2, causes the covalent addition of polymers of ADP-ribose to protein targets. hPARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct damage to the DNA. hPARP2 may be used to identify antagonists which may be used to treat a human having a disorder mediated by PARP2 neoplastic issue growth disorders. hPARP2 and antibodies to it, can also be used to diagnose these conditions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequences given in AAC85321-40 and AAC85342-51 are primers which were used in the construction of baculovirus expression vectors for the verpession of the fusion protein PARPIA/PARP2B. This protein contains amino acids 1-662 of hPARPI fused upstream of amino acids 30-583 of hPARP2. The fusion protein coding sequence is given in AAC85341. The protein of the invention, hPARP2, causes the covalent addition of polymers of ADP-ribose to protein targets. hPARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct damage to the DNA. hPARP2 may be used to identify antagonists which may be used to treat a human having a disorder mediated by PARP2 activity, such as, inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders. hPARP2 and antibodies to it, can also be used to diagnose these conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  such
